Automated Network Request Management System

Date	October 3, 2026
Team ID	
Project Name	Automated Network Request Management System
Maximum Marks	4 Marks

SCENARIO Requesting, approving, and tracking a network connection through the Service Catalog	 Entice (Discovery) How does someone initially become aware of this process?	 Enter (Form Fill) What do people experience as they begin the process?	 Engage (Approval & Processing) In the core moments in the process, what happens?	 Exit (Fulfillment Notice) What do people typically experience as the process finishes?	 Extend (Tracking & Audit) What happens after the experience is over?
Steps What does the person (or group) typically experience?	User identifies a need for network provisioning and opens the Service Portal.	User selects Network Request, fills out required fields, and submits.	Workflow Studio creates DAT... record and routes approval to the manager.	Manager approves request; system triggers email via sys_email.	User views completed status and logs for future reference.
Interactions What interactions do they have at each step? (People, places, things / touchpoints)	Service Portal, Service Catalog UI.	Catalog Item form, UI Policies (visible/hide of ID field).	Flow Designer engine, Approvals related list, u_database_tables.	ServiceNow Email Engine (sys_email), User inbox.	ServiceNow Record History / Audit Logs.
Goals & motivations At each step, what is a person's primary goal or motivation?	Find a fast, direct way to request network access without manual paperwork.	Submit accurate details without running into form validation errors.	Ensure approval is routed instantly to avoid work delays.	Receive immediate confirmation that the request was approved.	Track request lifecycle transparently.
Positive moments What steps does a typical person find enjoyable, productive, fun, motivating, delightful, or exciting?	Catalog item is easily searchable on portal.	Fields dynamically appear/hide based on connection choices.	Auto-created DAT... record maps all variables perfectly.	High-visibility formatted email preview confirms approval (REQ0010003 approved).	Clear record trace across REQ, RITM, and DAT tables.
Negative moments / risks What steps does a typical person find frustrating, confusing, angering, costly, or time-consuming?	Confusion over where to request network access.	Risk of missing mandatory fields if UI policies aren't enforced.	Delays if approvals stall without notifications.	Misformatted raw HTML body in emails if templates fail.	Inability to track backend custom table status.
Areas of opportunity How might we make each step better? What ideas do we have?	Highlight popular catalog items on portal homepage.	Add inline tooltips for complex network field options.	Implement auto-escalation for pending approvals.	Personalize email body layouts with direct portal link buttons.	Provide live status dashboards for end users.
