

Project Design Phase-II
Solution Requirements (Functional & Non-functional)

Date	October 3, 2026
Team ID	
Project Name	Automated Network Request Management System
Maximum Marks	4 Marks

Functional Requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Service Catalog Submission	• Catalog item (Network Request) creation on Service Portal • Input fields for Requested For, Mobile Number, Customer Address, Type of Connection, Mode of Payment, and Total Amount
FR-2	Client-Side Form Validation	• Dynamic visibility toggling via Catalog UI Policies (visible/hide of ID field) • Enforcement of mandatory fields prior to form submission
FR-3	Database Record Management	• Automated generation of records in custom table u_database_tables • Standardized record indexing using DAT auto-numbering (e.g., DAT0001004) • Automated variable mapping from catalog variables to table columns
FR-4	Workflow & Approval Routing	• Automated flow execution in Workflow Studio / Flow Designer upon request submission • Routing approval requests to designated approvers/managers • Dynamic update of request approval state (Requested → Approved / Rejected)
FR-5	Email Notification Engine	• Automated trigger of notification action via Flow Designer • Dynamic data pill population in email template (sys_email log) • Rendered HTML email body showing Request ID (REQ...), Item ID (RITM...), and status updates

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	The Service Catalog interface provides an intuitive layout with clear, dynamic field toggles driven by UI Policies, reducing form submission errors and user effort.
NFR-2	Security	Role-based Access Control (RBAC) restricts access to sensitive custom tables (u_database_tables), ensuring only authorized IT personnel and system administrators can modify record statuses.
NFR-3	Reliability	Automated Flow Designer workflows ensure 100% execution consistency for record generation, approval task assignments, and email delivery without manual intervention.
NFR-4	Performance	Form submission processing, record creation in u_database_tables, and approval routing execute with minimal latency (<2 seconds) on the ServiceNow platform.
NFR-5	Availability	Built on ServiceNow Cloud Architecture, providing high availability (99.99% uptime) for continuous end-user access to the Service Catalog portal.
NFR-6	Scalability	Capable of handling high volumes of concurrent network requests across enterprise teams without impacting database mapping or notification dispatching performance.
